STATEMENT

General Information

- *It is an expectation that all patients receive care/services from a licensed clinician.- All appropriate supporting documentation, including recent pertinent office visit notes, laboratory data, and results of any special testing must be provided. ~~If applicable:~~ All prior relevant imaging results and the reason that alternative imaging cannot be performed must be included in the documentation submitted.*
- *Where a specific clinical indication is not directly addressed in this guideline, medical necessity determination will be made based on widely accepted standard of care criteria. These criteria are supported by evidence-based or peer-reviewed sources such as medical literature, societal guidelines and state/national recommendations.*
- *The guideline criteria in the following sections were developed utilizing evidence-based and peer-reviewed resources from medical publications and societal organization guidelines as well as from widely accepted standard of care, best practice recommendations.*

Purpose

Magnetic resonance imaging (MRI) produces high quality multiplanar images of organs and structures within the body without using ionizing radiation. ~~It is used for evaluation, assessment of severity, and follow-up of diseases of the spine and is the preferred modality for imaging intervertebral disc degeneration. High contrast resolution (soft tissue contrast) and multiplanar imaging (sagittal as well as axial planes) are helpful in the evaluation of possible disc herniation and detecting nerve root compression. MRI is one of the most useful techniques to evaluate spine infection and is also used to evaluate tumors, cancer, and immune system suppression. It is the preferred modality for evaluating the internal structure of the spinal cord, providing assessment of conditions such as degenerative disc pathology, osteomyelitis, and discitis.~~

Special Note

If there is a combination request* for an overlapping body part, either requested at the same time or sequentially (within the past 3 months-), one of the following must be demonstrated:

- The results of the prior study should be inconclusive or show a need for additional or follow-up imaging evaluation ~~OR~~
- The office notes should clearly document an indication why overlapping imaging is needed and how it will change management for the patient (the entire spinal cord and/or autonomic postganglionic chain must be assessed).

(*Unless approvable in the **combination section** as noted in the guidelines)

INDICATIONS FOR THORACIC SPINE MRI

Evaluation of Neurologic Deficits ^{(1),~~2~~}

- With any of the following new neurological deficits documented on physical exam that localizes to the thoracic spine
 - Extremity muscular weakness (~~and~~ not likely caused by plexopathy or peripheral neuropathy)⁽³⁾
 - Pathologic reflexes (e.g., Babinski, Lhermitte's sign ⁽⁴⁾₇⁽²⁾, Chaddock Sign ⁽⁵⁾₇⁽³⁾, Hoffman's and other upper motor neuron signs); **OR** abnormal deep tendon reflexes (~~and~~ not likely caused by plexopathy, or peripheral neuropathy)
 - Absent/decreased ~~sensory changes~~sensation along a particular thoracic dermatome (nerve distribution): pin prick, touch, vibration, proprioception, or temperature **weakness** (and not likely caused by plexopathy, or peripheral neuropathy)
 - Upper or lower extremity increase muscle tone/spasticity ~~and likely localized to the thoracic spinal cord~~
 - New onset bowel or bladder dysfunction (e.g., retention or incontinence)—not related to an inherent bowel or bladder process
 - Gait abnormalities, ~~most likely cause by a suspected or known myelopathy~~ (see **Table 1** below for more details)
- Suspected thoracic cord compression with any neurological deficits as listed above

Evaluation of Back Pain ~~(6,7)~~(1)

With any of the following:

- With new or worsening objective **neurologic deficits** (~~as listed above~~) on exam, as above
- Failure of **conservative treatment*** for a minimum of six (6) weeks within the last six (6) months;

NOTE - Failure of conservative treatment is defined as one of the following:

- Lack of meaningful improvement after a full course of treatment; **OR**
- Progression or worsening of symptoms during treatment; **OR**
- Documentation of a medical reason the member is unable to participate in treatment
Closure of medical or therapy offices, patient inconvenience, or noncompliance without explanation does not constitute "inability to complete" treatment.
- With progression or worsening of symptoms during the course of **conservative treatment***
- With an abnormal electromyography (EMG) or nerve conduction study (if performed) indicating a thoracic radiculopathy ~~(EMG is not recommended to determine the cause of axial lumbar, thoracic, or cervical spine pain)~~⁽⁸⁾_(4,5)
- Isolated back pain in pediatric population^(9,10) ~~(when at least ONE of the following red flags are present~~ ^(6,7) is present (Note: conservative care not required if red flags are present). ~~Red flags that prompt imaging include any ONE of the following:~~

- Age 5 or younger
- Constant pain
- Pain lasting > 4 weeks
- Abnormal neurologic examination
- Early morning stiffness and/or gelling
- Night pain that prevents or disrupts sleep
- Radicular pain
- Fever ~~or~~, weight loss, or malaise
- Postural changes (e.g., kyphosis or scoliosis)
- Limp (or refusal to walk in a younger child)

Pre-Operative/Post-Operative/Procedural Evaluation

As part of initial pre-operative/post-operative/procedural evaluation (The best examinations are CT to assess for hardware complication, extent of fusion and pseudarthrosis and MRI for cord, nerve root compression, disc pathology, or post-op infection)^(7,11)

- For preoperative evaluation/planning
- Prior to spinal cord stimulator to exclude canal stenosis if no prior MRI imaging of the thoracic spine has been done recently⁽¹²⁾
- CSF leak highly suspected and supported by patient history and/or physical exam findings (leak (known or suspected spontaneous (idiopathic) intracranial hypotension (SIH), post lumbar puncture headache, post spinal surgery headache, orthostatic headache, rhinorrhea or otorrhea, or cerebrospinal venous fistula or dural fistula))
- A follow-up study may be needed to help evaluate a patient's progress after treatment, procedure, intervention, or surgery in the last 6 months. Documentation requires a medical reason that clearly indicates why additional imaging is needed for the type and area(s) requested (routine surveillance post-op not indicated without symptoms)
- ~~Surgical infection as evidenced by signs/symptoms, laboratory, or prior imaging findings~~
- New or changing neurological deficits or symptoms post-operatively⁽¹³⁾ (see neurological deficit section above).
- When combo requests (see above statement*) are submitted (i.e., MRI and CT of the spine), the office notes should clearly document the need for both studies to be done simultaneously (e.g., the need for both soft tissue and bony anatomy is required)⁽¹⁴⁾
 - Combination requests where both thoracic spine CT and MRI thoracic spine are both approvable (not an all-inclusive list):
 - OPLL (Ossification of posterior longitudinal ligament)
 - Most common in cervical spine (rare but more severe in thoracic spine)⁽¹⁵⁾

- ~~● Pathologic or complex fractures~~
- ~~● Malignant process of spine with both bony and soft tissue involvement~~
- ~~● Clearly documented indication for bony and soft tissue abnormality where assessment will change management for the patient~~

Evaluation of Suspected Myelopathy [\(16,17\)](#)^(8,9)

- ~~● Does **NOT** require conservative care~~

- Progressive symptoms including unsteadiness, broad-based gait, increased muscle tone, pins and needles sensation, weakness and wasting of the lower limbs, diminished sensation to light touch, temperature, proprioception, and vibration; limb hyperreflexia and pathologic reflexes; bowel and bladder dysfunction in more severe cases

- Any of the **neurological deficits** as noted above

NOTE: Does **NOT** require conservative care

Evaluation of Known or Suspected Multiple Sclerosis

[\(16,18\)](#)^(9,10)

- Suspected or known multiple sclerosis (MS) with new or changing symptoms suggesting underlying thoracic spinal cord disease (i.e., transverse myelitis, progressive myelopathy)
- Suspected or known pediatric demyelinating diseases (MS/ADEM)

~~Combination Studies for Multiple Sclerosis~~

~~**Note:** These body regions might be evaluated separately or in combination as guided by physical examination findings (e.g., localization to a particular segment of the spinal cord), patient history (e.g., symptom(s), time course, and where in the CNS the likely localization(s) is/are), and other available information, including prior imaging.~~

- ~~● **Cervical and/or Thoracic MRI** For evaluation of highly suspected multiple sclerosis (MS) when Brain MRI has indeterminate findings and/or does not fulfill the McDonald criteria for the diagnosis of MS~~
- **Cervical and/or Thoracic MRI with suspected transverse myelitis**—with appropriate clinical symptoms (e.g., bilateral weakness, sensory disturbance, and autonomic dysfunction which typically evolve over hours or days)
- **Brain MRI with Cervical and/or Thoracic MRI** For evaluation of neuromyelitis optica spectrum disorders (recurrent or bilateral optic neuritis; recurrent transverse myelitis)⁽¹⁰⁾₍₁₁₎
- **Known MS—entire CNS axis (Brain, and/or Cervical and/or Thoracic spine) is approvable** For known MS, prior to the initiation or change of disease modification treatments and assess disease burden (to establish a new baseline)^(10,12)

- ~~Known MS~~—Follow-up scans, including brain and spine imaging, if patients have known ~~thoracic~~cervical spine disease:
 - ~~3-6-12~~ months after starting/changing treatment
 - ~~Every 1-2 years while~~6-12 months until stable on disease -modifying ~~therapy~~treatment
 - Once stable on disease modifying treatment, every 1-2 years to assess for subclinical disease activity, less frequently when stable for 2-3 years

Evaluation of Trauma or Acute Injury ~~(20)~~(13)

- Presents with any of the following **neurological deficits** as above
- With progression or worsening of symptoms during the course of **conservative treatment***
- History of underlying spinal abnormalities (i.e., ankylosing spondylitis, diffuse idiopathic skeletal hyperostosis) (Both MRI and CT are approvable)^(21,22) _(14,15)
- When the patient is clinically unevaluable or there are preliminary imaging findings (x-ray or CT) needing further evaluation

~~MRI and CT provide complementary information. When indicated it is appropriate to perform both examinations~~

Evaluation of ~~of Known or New~~ Compression Fractures ~~(7,20)~~(16)

~~(With Worsening Back Pain)~~

- With history of malignancy
 - To aid in differentiation of benign osteoporotic fractures from metastatic disease
 - A follow-up MRI in 6-8 weeks after initial MRI when initial imaging cannot decipher (indeterminate) benign osteoporotic fracture from metastatic disease⁽²³⁾
- Fracture on initial imaging in a young patient (<50) with no history of trauma and concern for pathologic fracture
- Fracture with imaging characteristics concerning for underlying malignancy
- With an associated new focal **neurologic deficit** as above⁽²⁰⁾
- Prior to a planned surgery/intervention or if the results of the MRI will change management

Evaluation of Tumor, Cancer, or Metastasis

With any of the following:

~~MRI is usually the preferred study but CT may be needed to further characterize solitary indeterminate lesions seen on MRI~~^(7,24,25)

- **Primary tumor**⁽¹⁷⁾
 - Initial staging primary spinal tumor⁽²⁶⁾
 - Follow-up of known primary cancer of patient undergoing active treatment within the past year or as per surveillance imaging guidance for that cancer
 - Known **spinal primary** tumor with new signs or symptoms (e.g., new or increasing nontraumatic pain, physical, laboratory, and/or imaging findings)
 - With an associated new focal **neurologic deficit** as above⁽²⁰⁾
- **Metastatic tumor**⁽¹⁸⁾
 - With evidence of metastasis on bone scan needing further clarification **OR** inconclusive findings on a prior imaging exam
 - With an associated new focal **neurologic deficit as above**⁽²⁰⁾
 - Known malignancy with new signs or symptoms (e.g., new or increasing nontraumatic pain, radiculopathy or back pain that occurs at night and wakes the patient from sleep with known active cancer, physical, laboratory, and/or imaging findings) in a tumor that tends to metastasize to the spine^{(7,27,28)(19)}(+)

~~FURTHER EVALUATION OF INDETERMINATE FINDINGS~~

~~Unless follow up is otherwise specified within the guideline~~

- ~~For initial evaluation of an inconclusive finding on a prior imaging report that requires further clarification.~~
- ~~One follow up exam of a prior indeterminate MRI/CT finding to ensure no suspicious interval change has occurred. (No further surveillance unless specified as highly suspicious or change was found on last follow up exam).~~

Evaluation of Known or Suspected Infection

~~/Abscess/Inflammatory disease~~^(29,30)⁽²⁰⁾

~~When Thoracic Spine MRI is contraindicated or cannot be performed~~

~~● Infection~~

~~E.g., Osteomyelitis or abscess~~

- As evidenced by signs and/or symptoms, laboratory (i.e., abnormal white blood cell count, ESR and/or CRP) or prior imaging findings
- Follow-up imaging of infection
 - With worsening symptoms/laboratory values (i.e., white blood cell count, ESR/CRP)

or radiographic findings

Evaluation of Known or Suspected Inflammatory Disease (20)

- Spondyloarthropathies, known or suspected
 - Ankylosing Spondylitis/Spondyloarthropathies with non-diagnostic or indeterminate x-ray and appropriate rheumatology workup
- Known and suspected neuroinflammatory conditions (such as sarcoidosis, Bechet's)
 - Initial evaluation of suspected neuroinflammatory conditions after initial workup and detailed neurological examination
 - Follow-up of known neuroinflammatory conditions when there are either:
 - New or worsening signs or symptoms OR
 - To evaluate treatment response
 - _____

~~E.g.,~~ **Osteomyelitis**

Evaluation of Spine Abnormalities Related to Immune System Suppression (29)(20)

~~E.g.,~~ **HIV, chemotherapy, leukemia, or lymphoma**

- — As evidenced by signs/symptoms, laboratory, or prior imaging findings

●

~~E.g.,~~ **HIV, chemotherapy, leukemia, or lymphoma**

Other Indications ~~for a Thoracic Spine MRI~~

Note: See combination requests, below, for initial advanced imaging assessment and pre-operatively

- Tethered cord or spinal dysraphism (known or suspected), based on preliminary imaging, neurological exam, and/or high-risk cutaneous stigmata (31,32,33)(21-23)
- Known Arnold-Chiari syndrome (For **initial imaging** (one-time initial ~~modality~~ assessment) see ~~combination~~ combination below)
 - Known Chiari I malformation without syrinx or hydrocephalus, follow-up imaging after initial diagnosis with new or changing signs/symptoms or exam findings consistent with spinal cord pathology (34)(24)
 - Known Chiari II (Arnold-Chiari syndrome), III, or IV malformation
- Syrinx or syringomyelia (known or suspected)
 - With neurologic findings and/or predisposing conditions (e.g., Chiari malformation, prior trauma, neoplasm, arachnoiditis, severe spondylosis)(35) (25)

- To further characterize a suspicious abnormality seen on prior imaging
- Known syrinx with new/worsening symptoms
- Toe walking in a child with signs/symptoms of myelopathy ([upper motor neuron signs/hyperreflexia](#)) localized to the thoracic spine ⁽³⁶⁾⁽²⁶⁾
- [CSF leak highly suspected and supported by patient history and/or physical exam findings \(e.g., known or suspected spontaneous intracranial hypotension \(SIH\), post lumbar puncture headache, post spinal surgery headache, orthostatic headache, rhinorrhea or otorrhea, or cerebrospinal-venous fistula ~~\(CT myelogram\)~~\)](#) ⁽²⁷⁾

PREOPERATIVE OR POSTOPERATIVE ASSESSMENT

When **not** otherwise specified in the guideline:

Preoperative Evaluation:

- [Prior to spinal cord stimulator to exclude canal stenosis if no prior MRI imaging of the thoracic spine has been done recently](#) ⁽²⁸⁾
- [Imaging of the area requested is needed to develop a surgical plan](#)

Postoperative Evaluation:

- [Evaluation of post operative pseudarthrosis, hardware complication and/or extent of fusion after initial x-rays](#)

NOTE: [for this indication, advanced imaging should not occur until > 6 months after surgery](#)

- [Surgical infection as evidenced by signs/symptoms, laboratory, or prior imaging findings](#)
- [New or changing neurological deficits or symptoms post-operatively](#) ⁽²⁹⁾ [\(see neurological deficit section above\)](#).
- [Known or suspected complications](#)
- [A clinical reason is provided how imaging may change management](#)

NOTE: [This section applies only within the first few months following surgery unless otherwise specified](#)

FURTHER EVALUATION OF INDETERMINATE FINDINGS

Unless follow-up is otherwise specified within the guideline

- [For initial evaluation of an inconclusive finding on a prior imaging report that requires further clarification.](#)
- [One follow-up exam of a prior indeterminate MRI/CT finding to ensure no suspicious interval change has occurred. \(No further surveillance unless specified as highly](#)

suspicious or change was found on last follow-up exam).

- ~~Suspected neuroinflammatory Conditions/Diseases (e.g., sarcoidosis, Behcet's) After detailed neurological exam and appropriate initial work-up completed~~
- ~~Follow-up known neuroinflammatory Conditions/Diseases (e.g., sarcoidosis, Behcet's) with new or worsening signs/symptoms or to evaluate treatment response~~

IMAGING IN KNOWN GENETIC SYNDROMES AND RARE DISEASES/CONDITIONS

- Von Hippel-Lindau (VHL) at least every other year/LZTR1-related Schwannomatosis ⁽³⁰⁾:
 - Every 2 years starting at age 16⁽³⁷⁾12
- Neurofibromatosis 1 (NF1) ^(31,32):
 - Signs and symptoms concerning for spinal tumor
- NF2-Related Schwannomatosis ⁽³³⁾:
 - Signs and symptoms concerning for spinal tumor
- SMARCA4 and SMARCB1 (Includes SMARCB1-associated Schwannomatosis and Rhabdoid Tumor Predisposition Syndrome) ^(30,34):
 - At diagnosis
 - Monthly from age 0-6 months
 - Every 2 months from age 7-18 months
 - Every 3 months from age 19 months – 5 years
 - Annually after age 5
- Von Hippel-Lindau (VHL) ⁽³⁵⁾:
 - Annually (including at diagnosis) starting at age 11
- For other syndromes and rare diseases not otherwise addressed in the guideline, coverage is based on a case-by-case basis using societal guidance.

Combination Studies for Known Genetic Conditions

NOTE: When medical necessity is met for an individual study **AND** conscious sedation is required (such as for young pediatric patients or patients with significant developmental delay), the entire combination is indicated.)

Cervical Spine/Thoracic Spine/Lumbar Spine MRI

- LZTR1-related Schwannomatosis ⁽³⁰⁾:
 - Every 2 years starting at age 12

- Marfan Syndrome ⁽³⁶⁾:
 - For low back pain, proximal leg pain, genital/rectal pain OR
 - Weakness and numbness above knee
- NF2-Related Schwannomatosis ⁽³³⁾:
 - Signs and symptoms concerning for spinal tumor

Brain/Cervical Spine/Thoracic Spine/Lumbar Spine MRI

- Neurofibromatosis 1 (NF1) ^(31,32):
 - Signs and symptoms concerning for brain or spinal tumor

Brain/Cervical Spine/Thoracic Spine/Lumbar Spine/Abdomen MRI

- Von Hippel-Lindau (VHL) every 2 years starting at age 15 ⁽³⁵⁾:
 - Annually (including at diagnosis) starting at age 11

Brain MRI/Cervical Spine/Thoracic Spine/Lumbar Spine/Whole Body MRI

- SMARCA4 and SMARCB1 (Includes SMARCB1-associated Schwannomatosis and Rhabdoid Tumor Predisposition Syndrome) ^(30,34):
 - At diagnosis
 - Monthly from age 0-6 months
 - Every 2 months from age 7-18 months
 - Every 3 months from age 19 months – 5 years
 - Annually after age 5

OTHER COMBINATION STUDIES WITH THORACIC SPINE MRI

Note: When medical necessity is met for an individual study **AND** conscious sedation is required (such as for young pediatric patients or patients with significant developmental delay), the entire combination is indicated. ~~**Note:** Combination studies can be approved criteria is met for one of the above indications and is being performed in a child under 8 years of age who will need anesthesia for the procedure~~

Thoracic Spine MRI and /Thoracic Spine CT

- OPLL (Ossification of posterior longitudinal ligament) ⁽³⁷⁾

- Pathologic or complex fractures
- Malignant process of spine with both bony and soft tissue involvement
- Unstable craniocervical junction
- Clearly documented indication for bony and soft tissue abnormality where assessment will change management for the patient

Brain/Cervical Spine/Thoracic Spine MRI

- Combination studies for MS: These body regions might be evaluated separately or in combination as guided by physical examination findings (e.g., localization to a particular segment of the spinal cord), patient history (e.g., symptom(s), time course, and where in the CNS the likely localization(s) is/are), and other available information, including prior imaging.
 - For evaluation of neuromyelitis optica spectrum disorders (recurrent or bilateral optic neuritis; recurrent transverse myelitis) ^{(38),(11)}
 - For known MS, prior to the initiation or change of disease modification treatments and assess disease burden (to establish a new baseline) ^{(39,40),(10,12)}
 - Follow-up scans, including brain and spine imaging, if patients have known spine disease:
 - 3-6-12 months after starting/changing treatment
 - Every 1-2 years while 6-12 months until stable on disease-modifying therapy treatment
 - Once stable on disease modifying treatment, every 1-2 to assess for subclinical disease activity, less frequently when stable for 2-3 years

Brain-MRI/Cervical Spine-MRI/-Thoracic Spine-MRI/Lumbar Spine MRI (any Combination)

- For initial evaluation of a suspected Arnold Chiari malformation
- Follow-up imaging of a known type II or type III Arnold Chiari malformation. ~~For Arnold Chiari type I, follow-up imaging only if new or changing signs/symptoms~~ ^(41,42,43) For Arnold Chiari type I, follow-up imaging only if new or changing signs/symptoms ^(21,38-40)
- Oncological Applications (e.g., primary nervous system, metastatic) ⁽¹⁷⁾
 - Drop metastasis from brain or spine
 - Suspected leptomeningeal carcinomatosis ⁽⁴⁴⁾⁽⁴¹⁾
 - Known tumor evaluation and monitoring in neurocutaneous syndromes
- CSF leak highly suspected and supported by patient history and/or physical exam findings (e.g., known or suspected spontaneous ~~(idiopathic)~~ intracranial hypotension (SIH), post lumbar puncture headache, post spinal surgery headache, orthostatic headache, rhinorrhea or otorrhea, or cerebrospinal-venous fistula) ⁽²⁷⁾

- ~~For evaluation of known Arnold-Chiari Malformation~~
- Tumor evaluation and monitoring in cancer predisposition syndromes
 - ~~Von Hippel Lindau (VHL) - imaging of the brain and spinal cord for hemangioblastomas every 2 years starting at age 14~~ ^(45,46,47)
 - ~~Rhabdoid Tumor Predisposition Syndrome - Brain and Spine MRI At diagnosis and monthly age 0-6 months if whole body MRI not done; Q2-3 months age 7-18 months, Q3 months age 19 months-5 years~~
 - ~~NF-2 - Brain IAC annually starting at the age of 10 years and spinal imaging at baseline and every 2 to 3 years with more frequent imaging, if warranted, based on sites of tumor involvement~~ ⁽⁴⁸⁾
 - ~~Schwannomatosis - Brain and spine MRI every two to three years beginning at age 12 years~~

Note: diagnosis is met with both genetic testing AND clinical features due to incomplete penetrance

Cervical and Spine/Thoracic Spine MRI

- Initial evaluation of known or suspected syrinx or syringomyelia
 - With neurologic findings and/or predisposing conditions (e.g., Chiari malformation, prior trauma, neoplasm, arachnoiditis, severe spondylosis) ⁽³⁵⁾⁽²⁵⁾
 - To further characterize a suspicious abnormality seen on prior imaging
 - Known syrinx with new/worsening ~~symptoms~~ symptoms
 - For evaluation of highly suspected multiple sclerosis (MS) when Brain MRI has indeterminate findings and/or does not fulfill the McDonald criteria for the diagnosis of MS
 - With suspected transverse myelitis - with appropriate clinical symptoms (e.g., bilateral weakness, sensory disturbance, and autonomic dysfunction which typically evolve over hours or days)

Cervical and/or Spine/Thoracic and/or Spine/Lumbar MRIs (any Combination) Spine MRI

Note: These body regions might be evaluated separately or in combination as documented in the clinical notes by physical examination findings (e.g., localization to a particular segment of the spinal cord), patient history, and other available information, including prior imaging.

Exception - Indications for combination studies ^(49,50): Are approved indications as noted below and being performed in children who will need anesthesia for the procedure

- ~~Any combination of these studies for:~~
- Survey/complete initial assessment of infant/child with congenital scoliosis or juvenile idiopathic scoliosis under the age of 10 ^{(51,52,53)(42,43)} (e.g., congenital scoliosis, idiopathic scoliosis, scoliosis with vertebral anomalies)

- In the presence of neurological deficit, progressive spinal deformity, or for preoperative planning ⁽⁵⁴⁾(44,45)
- Back pain with known vertebral anomalies (hemivertebrae, hypoplasia, agenesis, butterfly, segmentation defect, bars, or congenital wedging) in a child on preliminary imaging
- Scoliosis with any of the following ⁽⁵⁵⁾(45,46):
 - Progressive spinal deformity
 - Neurologic deficit (new or unexplained)
 - Early onset
 - Atypical curve (e.g., short segment, >30° kyphosis, left thoracic curve, associated organ anomalies)
 - Pre-operative planning; ~~OR~~
 - When office notes clearly document how imaging will change management
- Arnold-Chiari malformations ^(33,56)(21,47)
 - Arnold-Chiari I
 - For evaluation of spinal abnormalities associated with initial diagnosis of Arnold-Chiari Malformation. (C/T/L spine due to association with tethered cord and syringomyelia), and initial imaging has not been completed ⁽⁵⁴⁾(43)
 - Arnold-Chiari II-IV - For initial evaluation and follow-up as appropriate
 - Usually associated with open and closed spinal dysraphism, particularly meningomyelocele ⁽³⁴⁾(23)
- Tethered cord, or spinal dysraphism (known or suspected) based on preliminary imaging, neurological exam, and/or high-risk cutaneous stigmata ^(31,32,33) (21-23) when anesthesia required for imaging ⁽⁵⁷⁾(48) (e.g., meningomyelocele, lipomeningomyelocele, diastematomyelia, fatty/thickened filum terminale, and other spinal cord malformations)
- Oncological Applications (e.g., primary nervous system, metastatic) ⁽¹⁷⁾
 - Drop metastasis from brain or spine (imaging also includes brain)
 - Suspected leptomeningeal carcinomatosis (LC) ⁽⁵⁸⁾ (49)
 - ~~○ Any combination of these for spinal survey in patient with metastases~~
 - Known tumor evaluation and monitoring in neurocutaneous syndromes
- CSF leak highly suspected and supported by patient history and/or physical exam findings (~~leak~~ (e.g., known or suspected spontaneous (idiopathic) intracranial hypotension (SIH), post lumbar puncture headache, post spinal surgery headache, orthostatic headache, rhinorrhea or otorrhea, or cerebrospinal-venous fistula) ⁽⁵⁹⁾ (27)

Combination Studies for Malignancy for Initial Staging or Restaging

Unless otherwise specified in this guideline, indication for combination studies for malignancy for initial staging or restaging:

- Concurrent studies to include CT or MRI of any of the following areas as appropriate depending on the cancer: Abdomen, Brain, Chest, Neck, Pelvis, Cervical Spine, Thoracic Spine or Lumbar Spine.

BACKGROUND

*Conservative Treatment

Non-operative conservative treatment should include a multimodality approach consisting of at least one (1) active and one (1) inactive component targeting the affected region.

Active Modalities

- Physical therapy
- Physician-supervised home exercise program**
- Chiropractic care

Inactive Modalities

- Medications (e.g., NSAIDs, steroids, analgesics)
- Injections (e.g., epidural injection, selective nerve root block)
- Medical Devices (e.g., TENS unit, bracing)

**Home Exercise Program

The following two elements are required to meet conservative therapy guidelines for HEP ⁽⁴⁴⁾⁽¹⁾:

- Documentation of an exercise prescription/plan provided by a physician, physical therapist, or chiropractor; **AND**
- Follow-up documentation regarding completion of HEP after the required 6-week timeframe or inability to complete HEP due to a documented medical reason (e.g., increased pain or inability to physically perform exercises).

Gait and Spine Imaging

Table 1⁽⁶⁰⁾

| Gait | Characteristic | Work up/Imaging |
|---------------------------|---------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Homiparetic | Spastic unilateral, circumduction | Brain and/or, Cervical spine imaging based on associated symptoms |
| Diplegic | Spastic bilateral, circumduction | Brain, Cervical and Thoracic Spine imaging |
| Myelopathic | Wide-based, stiff, unsteady | Cervical and/or Thoracic spine MRI based on associated symptoms |
| Cerebellar Ataxic | Broad based, clumsy, staggering, lack of coordination, usually also with limb ataxia | Brain imaging see Brain MRI Guideline |
| Apraxic | Magnetic, shuffling, difficulty initiating | Brain imaging see Brain MRI Guideline |
| Parkinsonian | Stooped, small steps, rigid, turning en bloc, decreased arm swing | Brain Imaging see Brain MRI Guideline |
| Choreiform | Irregular, jerky, involuntary movements | Medication review, consider brain imaging as per movement disorder Brain MR guidelines |
| Sensory ataxic | Cautious, stomping, worsening without visual input (ie + Romberg) | EMG, blood work, consider spinal (cervical or thoracic cord imaging) |

| Gait | Characteristic | Work up/Imaging |
|-------------------|--------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | | imaging based on EMG |
| Neurogenic | Steppage, dragging of toes | <ul style="list-style-type: none"> ● EMG initial testing; ● BUT if there is a foot drop, lumbar spine MRI is appropriate without EMG ● Pelvis MR if there is evidence of plexopathy |
| Vestibular | Insecure, veer to one side, worse when eyes closed, vertigo | Consider Brain/IAC MRI see Brain MRI Guideline |

Myelopathy

Symptom severity varies, and a high index of suspicion is essential for making the proper diagnosis in early cases. Symptoms of pain and radiculopathy may not be present. The natural history of myelopathy is characterized by neurological deterioration. The most frequently encountered symptom is gait abnormality (86%), followed by increased muscular reflexes (79.1%), pathological reflexes (65.1%), paresthesia of upper limb (69.8%), and pain (67.4%)^(47%).⁽⁸⁾

Gait and Spine Imaging

Table 1 (50–53)

| <u>Gait</u> | <u>Characteristic</u> | <u>Work up/Imaging</u> |
|--------------------------|---------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| <u>Hemiparetic</u> | <u>Spastic unilateral, circumduction</u> | <u>Brain and/or, Cervical spine imaging based on associated symptoms</u> |

| <u>Myelopathic</u> | <u>Wide based, stiff, unsteady</u> | <u>Cervical and/or Thoracic spine MRI based on associated symptoms</u> |
| <u>Cerebellar Ataxic</u> | <u>Broad based, clumsy, staggering, lack of coordination, usually also with limb ataxia</u> | <u>Brain imaging</u> |
| <u>Apraxic</u> | <u>Magnetic, shuffling, difficulty initiating</u> | <u>Brain imaging</u> |
| <u>Parkinsonian</u> | <u>Stooped, small steps, rigid, turning</u> | <u>Brain Imaging</u> |

| <u>Gait</u> | <u>Characteristic</u> | <u>Work up/Imaging</u> |
|-----------------------|--------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | en bloc, decreased arm swing | |
| <u>Choreiform</u> | <u>Irregular, jerky, involuntary movements</u> | <u>Medication review, consider brain imaging as per movement disorder Brain MR guidelines</u> |
| <u>Sensory ataxic</u> | <u>Cautious, stomping, worsening without visual input (i.e. + Romberg)</u> | <u>EMG, blood work, consider spinal (cervical or thoracic cord imaging) imaging based on EMG</u> |
| <u>Neuropathic</u> | <u>Steppage, dragging of toes</u> | <u>EMG initial testing;</u> <u>BUT if there is a foot drop, lumbar spine MRI is appropriate without EMG</u> <u>Pelvis MR if there is evidence of plexopathy</u> |
| <u>Vestibular</u> | <u>Insecure, veer to one side, worse when eyes closed, vertigo</u> | <u>Consider Brain/IAC MRI</u> |

MRI and Neurocutaneous Syndromes

- ~~In NF-1, clinical evaluation appears to be more useful to detect complications than is screening imaging in asymptomatic patients. Imaging is indicated in evaluation of suspected tumors based on clinical evaluation and for follow-up of known intracranial and intraspinal tumors.⁽⁶¹⁾~~
- ~~Conversely in NF-2, routine MR imaging screening is always indicated, given the high prevalence of CNS tumors, especially vestibular schwannomas. In patients with NF-2, routine screening brain/IAC imaging is indicated annually starting from age 10, if asymptomatic, or earlier with clinical signs/symptoms. Most individuals with NF2 eventually develop a spinal tumor, mostly commonly schwannomas, but meningioma and ependymomas are also seen. Spinal imaging at baseline and every 2 to 3 years is also advised with more frequent imaging, if warranted, based on sites of tumor involvement.⁽⁶²⁾~~
- ~~In patients with Tuberous Sclerosis, Brain MRI should be obtained every 1-3 years up until age 25 for surveillance for CNS abnormalities.⁽⁶³⁾~~

~~**In Von Hippel Lindau Syndrome, imaging of the brain and spinal cord for hemangioblastomas is recommended every 2 years.⁽⁶⁴⁾**~~

Contraindications and Preferred Studies

- Contraindications and reasons why a CT/CTA cannot be performed may include: impaired renal function, significant allergy to IV contrast, pregnancy (depending on trimester)
- Contraindications and reasons why an MRI/MRA cannot be performed may include: impaired renal function, claustrophobia, non-MRI compatible devices (such as non-compatible defibrillator or pacemaker), metallic fragments in a high-risk location, patient exceeds weight limit/dimensions of MRI machine

SUMMARY OF EVIDENCE

ACR Appropriateness Criteria® Thoracic Back Pain ⁽¹⁾

Study Design: The document is a guideline developed by the ACR Expert Panel on Neurological Imaging. It reviews the appropriateness of various imaging procedures for different clinical scenarios involving thoracic back pain (TBP). The guidelines are based on a thorough literature review and expert consensus.

Target Population: The target population includes adults with thoracic back pain, categorized into several variants:

1. Acute thoracic back pain without myelopathy or radiculopathy and no red flags.
2. Subacute or chronic thoracic back pain without myelopathy or radiculopathy and no red flags.
3. Thoracic back pain with myelopathy or radiculopathy.
4. Thoracic back pain with one or more of the following: low-velocity trauma, osteoporosis, elderly individuals, or chronic steroid use.
5. Thoracic back pain with suspicion of cancer, infection, or immunosuppression.
6. Thoracic back pain with radiographic evidence of bone destruction, fracture, or spinal deformity.
7. Thoracic back pain post-thoracic spine surgery.

Key Factors

- **Imaging Procedures:** The document evaluates the appropriateness of various imaging modalities such as radiography, MRI, CT, bone scans, and FDG-PET/CT for each clinical scenario.
- **Radiation Levels:** It provides relative radiation levels for each imaging procedure to help assess the risk-benefit ratio.
- **Clinical Scenarios:** Each variant is discussed in detail, providing recommendations for initial imaging and follow-up based on the presence of specific clinical features and risk factors.
- **Expert Consensus:** The guidelines are developed through collaboration with various experts and organizations, ensuring a comprehensive and balanced approach.

ACR Appropriateness Criteria® Acute Spinal Trauma ⁽¹³⁾

Study Design: The document is a revised guideline by the American College of Radiology (ACR) for the appropriateness of imaging procedures in acute spinal trauma. It includes a summary of literature reviews, expert panel recommendations, and evidence-based criteria for various clinical scenarios.

Target Population: The guidelines focus on patients aged 16 years and older who have experienced acute blunt trauma to the cervical, thoracic, or lumbar spine. Specific criteria are provided for different age groups and clinical conditions, including low-risk patients, those with suspected arterial injury, and obtunded patients.

Key Factors:

Imaging Procedures: The document outlines the appropriateness of various imaging modalities such as CT, MRI, MRA, and radiography for different clinical scenarios. It emphasizes the use of CT without IV contrast as the initial imaging modality for most cases.

Clinical Criteria: The guidelines incorporate the NEXUS and Canadian C-Spine Rule (CCR) criteria for determining the need for cervical spine imaging. These criteria are based on factors such as age, mechanism of injury, and clinical symptoms.

Radiation Levels: The document includes relative radiation level designations for each imaging procedure, highlighting the importance of minimizing radiation exposure.

Expert Panel: The guidelines were developed by an expert panel on neurological imaging, including specialists from various institutions and organizations.

ACR Appropriateness Criteria® Management of Vertebral Compression Fractures: 2022 Update ⁽¹⁶⁾

Study Design: The study design involves the development and revision of the ACR Appropriateness Criteria, which are evidence-based guidelines for specific clinical conditions. These guidelines are reviewed annually by a multidisciplinary expert panel. The guideline development includes an extensive analysis of current medical literature from peer-reviewed journals and the application of well-established methodologies such as the RAND/UCLA Appropriateness Method and the Grading of Recommendations Assessment, Development, and Evaluation (GRADE) to rate the appropriateness of imaging and treatment procedures for specific clinical scenarios.

Target Population: The target population for this study includes individuals with vertebral compression fractures, which can be caused by various etiologies such as trauma, osteoporosis, or neoplastic infiltration. Osteoporosis-related fractures are the most common cause of VCFs and have a high prevalence among postmenopausal women and similarly aged men. The study also addresses VCFs caused by trauma and malignancies, including primary bone tumors and metastatic cancers.

Key factors:

- **The prevalence and causes of VCFs, highlighting the high incidence among postmenopausal women and the increasing incidence in men.**

- The importance of diagnostic imaging in characterizing VCFs and guiding treatment decisions.
- The use of various imaging modalities such as MRI, CT, FDG-PET/CT, and bone scans to evaluate VCFs.
- The management of both osteoporotic and pathologic VCFs, including medical management, percutaneous vertebral augmentation, and surgical consultation.
- The role of minimally invasive percutaneous image-guided techniques for treating spine tumors and the potential benefits of vertebral augmentation procedures.

ANALYSIS OF EVIDENCE

Shared Findings ^(1,13,16):

Imaging Techniques: All three articles emphasize the importance of imaging techniques in diagnosing and managing spinal conditions. They discuss various imaging modalities such as MRI, CT, and bone scans. MRI is frequently highlighted as the preferred imaging modality due to its ability to provide detailed soft tissue resolution and assess spinal canal patency.

Role of MRI: MRI is recommended for evaluating spinal conditions, particularly for identifying marrow replacing lesions, osseous destruction, canal compromise, and cord signal abnormalities. MRI with and without IV contrast is suggested for cases with suspected neoplasm, infection, or inflammation.

CT Imaging: CT is recognized for its high-resolution depiction of osseous structures and is useful for preoperative planning and assessing hardware integrity. CT myelography is mentioned as a complementary imaging technique, particularly for presurgical or preradiation treatment planning.

POLICY HISTORY

Summary

| Date | Summary |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| June 2025 | <ul style="list-style-type: none"> ● <u>Guideline name changed from Thoracic Spine MRI to Thoracic Spine Magnetic Resonance Imaging (MRI)</u> ● <u>Guideline number changed from Evolent CG 042 to Evolent CG 2057</u> ● <u>Added new bullet-point to the General Statement section</u> ● <u>Checked the Medicare Advantage box in the Applicable Lines of Business table</u> ● <u>Added a Summary of Evidence and Analysis of Evidence</u> |

| Date | Summary |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | <ul style="list-style-type: none"> ● Updated references and background ● MS <ul style="list-style-type: none"> ○ Moved combo section down ○ Changed follow up of known MS after changing or starting treatment to 3-6 months from 6-12 months ● Evaluation Compression Fractures <ul style="list-style-type: none"> ○ Added <ul style="list-style-type: none"> ■ Fracture on initial imaging in a young patient (<50) with no history of trauma and concern for pathologic fracture ■ Fracture with imaging characteristics concerning for underlying malignancy ● Updated the Genetics and Rare Diseases section |
| June 2024 | <ul style="list-style-type: none"> ● Aligned combination studies across guidelines ● Added contraindications and preferred studies section ● Added Genetics and Rare Diseases section ● Reduced background section ● Updated references |
| May 2023 | <ul style="list-style-type: none"> ● Updated references ● Updated background section ● Clarified pathological reflexes ● General Information moved to beginning of guideline with added statement on clinical indications not addressed in this guideline ● Added statement regarding further evaluation of indeterminate findings on prior imaging ● Clarified cerebellar ataxia in gait table ● Removed radicular pain and malaise from Isolated Back Pain in the Pediatric population: Red flags ● Removed Additional Resources |
