# Introduction

Louisiana consistently experiences some of the highest rates of sexually transmitted diseases (STDs) in the United States. In 2008, Louisiana had the highest rates in the nation for Primary and Secondary Syphilis and Congenital Syphilis according to the CDC's 2008 STD Surveillance Report. Additionally, Louisiana has the 2nd and 5<sup>th</sup> highest rates in the nation for Gonorrhea and Chlamydia respectively.<sup>2</sup> This annual report will provide an analysis of these common sexually transmitted diseases in order to inform STD treatment and prevention efforts across the state.

## Chlamydia

- In 2008, there was a 21.6% increase in reported Chlamydia Cases compared to 2007.
- The 2008 rate is 533.6 new cases per 100,000 population.
- Females represented 76% of all Chlamydia infections, and women between the ages of 15 and 19 had the highest incidence rate.

## Gonorrhea

- Gonorrhea cases decreased from 11,137 in 2007 to 9,766 in 2008.
- The Gonorrhea rate decreased by 14.7% from 259.4 cases per 100,000 in 2007 to 221 cases per 100,000 in 2008.
- Despite a reduction in cases, Louisiana's Gonorrhea maintained the 2<sup>nd</sup> highest rate in the nation in 2008.<sup>3</sup>

## Primary and Secondary Syphilis (P&S)

- Rates of P&S Syphilis in Louisiana have steadily increased since 2002. In 2008, the rate increased by
- The 20-24 age group has the highest incidence rate for both males and females.
- Males represented 57% of the cases reported in 2008.

**Table 1: STD Cases by Year, Louisiana 2000-2008**

# Chlamydia

## [CHLAMYDIA | 2008]

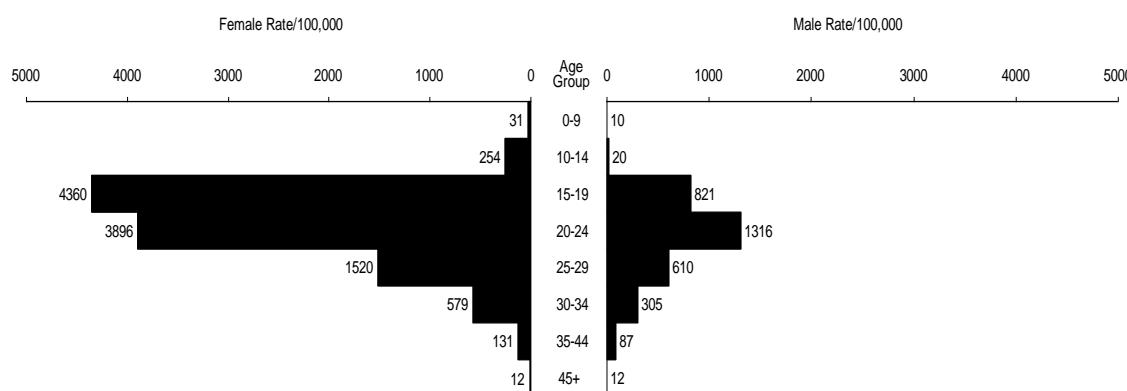

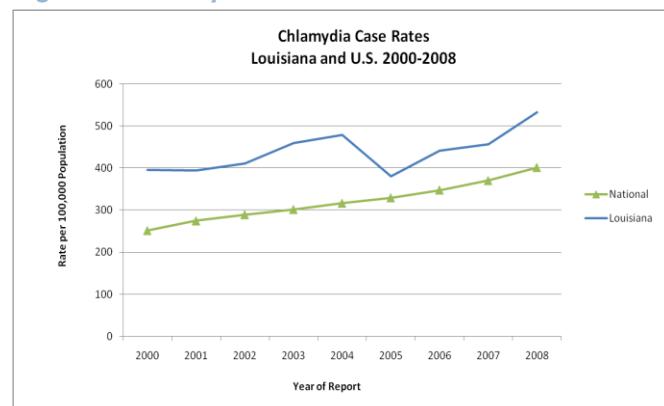

Caused by the bacterium *Chlamydia trachomatis*, Chlamydia is the most commonly reported STD in the United States.<sup>4</sup> Though chlamydial infections are often asymptomatic, symptoms can range from urethritis or vaginitis to severe pelvic inflammatory disorder (PID) in women. PID can cause infertility, ectopic pregnancy, and chronic pelvic pain.<sup>4</sup> Also, pregnant women with Chlamydia can pass the infection to their infants during delivery potentially causing health issues such as ophthalmia neonatorum or pneumonia.<sup>4</sup>

There were 23,536 cases of Chlamydia reported to the Louisiana STD Control Program in 2008, a rate of 533.6 cases per 100,000 population. This represents an 18% rate increase from 2007 to 2008. Additionally, Louisiana's ranking rose from the 7<sup>th</sup> to the 5<sup>th</sup> highest Chlamydia rate in the nation.<sup>2</sup> (Figure 1)

The number of Chlamydia cases has been increasing since 2005 with the greatest increase (21.6%) occurring from 2007 to 2008. This rise in cases is likely due to improved Chlamydia screening practices. Louisiana's public health units have replaced genetic probe testing with the Amplified Nucleic Acid Test which captures more positive cases. In addition, screening for Chlamydia is performed for all sexually active female patients under the age of 31 in family planning clinics.

- The 2008 female Chlamydia rate of 790.8 per 100,000 women was 3.13 times the male rate of 252.1 per 100,000 men.
- Among the 17,951 female Chlamydia cases, nearly 65% were African American and 14.5% were White. Of the 5,397 male cases, 73.5% were African American and 11% were White. (Table 2)
- In 2008, the highest age-specific rate for female Chlamydia was among 15-19 year olds, and the 20-24 age group had the highest age-specific rate for males. (Figure 2)

# Gonorrhea

## [GONORRHEA | 2008]

Gonorrhea is caused by the bacteria, *Neisseria gonorrhoea*.<sup>5</sup> If left untreated, Gonorrhea can affect fertility in males and females, increase the risk of HIV infection and transmission, and cause other serious health problems.<sup>5</sup> Gonorrhea is a common cause of epididymitis in men and PID in women, and both of these conditions can lead to infertility.<sup>5</sup> Also, pregnant women with Gonorrhea may infect their infants during delivery which can potentially cause blindness, joint infection, or a blood infection in babies.<sup>5</sup>

On April 13, 2007, the CDC released updated guidelines for the treatment of Gonorrhea in the United States.<sup>6</sup> The announcement stated that due to increasing resistance seen in gonococcal isolates, fluoroquinolones are no longer recommended for the treatment of Gonorrhea.<sup>6</sup> In previous studies, 15.1% of gonococcal isolates showed Fluoroquinolone resistance in 2006 and 16.1% in 2007.<sup>6</sup> The options for treating Gonorrhea are now limited to one class of antibiotics called cephalosporins.<sup>6</sup> Since fluoroquinolones such as ciprofloxacin were frequently used to treat gonorrhea, this announcement likely influenced Gonorrhea data for 2008.

- During 2008, there were 9,766 cases of Gonorrhea reported, a 12.3% decrease from 2007 and a 14.7% decrease in the Gonorrhea rate for Louisiana. This decrease may be attributed to a reduction in unsuccessful fluoroquinolone treatments of Gonorrhea.
- African Americans represented 75% of the 2008 Gonorrhea cases. Approximately 72% of females with Gonorrhea were African American and 81% of males. (Table 7)
- Females between 15 and 19 years of age had the highest Gonorrhea rate followed by 20-24 year old females and then 20-24 year old males. (Figure 3)

# Syphilis

## [PRIMARY AND SECONDARY SYPHILIS | 2008]

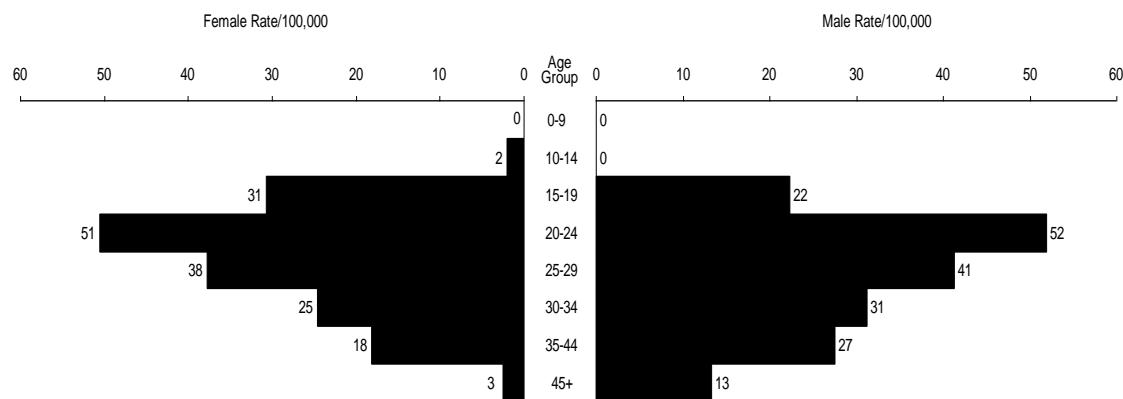

Syphilis is one of the three most commonly reported STDs. It is caused by the bacterium *Treponema pallidum* and is transmitted through contact with an infected genital ulcer. These ulcers also facilitate the sexual transmission and contraction of HIV.<sup>7</sup> The Primary and Secondary stages are the most infectious stages of Syphilis.

According to CDC Surveillance reports, Louisiana has consistently had high rates of Primary and Secondary Syphilis (P & S Syphilis) compared to other U.S states. Since 2006, Louisiana has ranked highest in the nation for Primary and Secondary Syphilis rates. Between 2007 and 2008, the rate increased by 30.2% from 12.6 to 16.4 per 100,000 population.

**Figure 5: Primary and Secondary Case Rates**

- There were 721 cases reported in 2008, a 35.3% increase compared to 533 cases reported in 2007.
- Nearly 86% of the 2008 cases were African American reflecting the significant health disparity that exists in Louisiana.
- In 2008, approximately 57% of Primary and Secondary Syphilis cases were males. (Table 12) Males also had the highest age and gender specific rate which was 52 per 100,000 in the male population aged 20 to 24 years. (Figure 6)

**Figure 6:**

## [CONGENITAL SYPHILIS | 2008]

Congenital Syphilis cases occur when a pregnant woman with Syphilis passes the infection on to her infant while carrying the baby. This can result in a stillbirth, death of the newborn, or significant future health and development problems.<sup>7</sup>

In Louisiana, there were a total of 24 Congenital Syphilis cases reported in 2008. This was a 38.6% reduction in cases compared to 2007 in which 38 cases were reported.

Louisiana's Congenital Syphilis rate declined from 58.4 cases per 100,000 live births in 2007 to approximately 36.3 per 100,000 live births in 2008. Despite this decrease, Louisiana Congenital Syphilis rate was the highest in the nation in 2008.<sup>2</sup>

**Figure 7: Congenital Syphilis Cases**

## [EARLY SYPHILIS | 2008]

A syphilis diagnosis with less than one year duration is considered to be "Early Syphilis." This designation covers the Primary, Secondary, and Early Latent stages of Syphilis. If not detected and treated early, Syphilis may lead to long-term health problems including blindness, dementia, paralysis, and other damage to internal organs.<sup>7</sup>

Table 17: Early Syphilis Comparison of Race, Ethnicity, and Gender-Specific Rates

	Primary and Secondary			Early Latent		
	Number	Percent	Rate	Number	Percent	Rate
<b>Gender</b>						
Women	310	43%	13.7	476	54%	21.0
Men	411	57%	19.2	407	46%	19.0
<b>Race/Ethnicity</b>						
White	90	12%	3.3	131	15%	4.8
